

Open Web Token (OWT) Service

- 1) AFTER the user are successfully Logged in to the system. The Client application will request OWT Service to Generate Encrypt Sign Token with the User Authenticated Information with other information that will be defined according to the specification of the OWT.
 - 2) The Client will then have the option of storing the Encrypt Sign Token in memory during runtime using a medium such as Session, Cookie or Hidden Field such that it provide a secure way retaining the Token to be use within the application to access an authorize service in a later time.
- (NOTE: Token do have expires time that are independent of the session container itself).
